Part B – Technical Documentation

Module & Main Form

The image displays several user interface components for a software application:

- Password Attempt One, Two, and Three:** These are small dialog boxes with a title bar, a close button (X), and a message "Please provide your password." Each contains a text input field and "OK" and "Cancel" buttons.
- Termination:** A dialog box with a title bar, a close button (X), and a message "Entered the wrong password too many times!" accompanied by a red error icon. It has an "OK" button.
- Main Form (Background):** A window titled "Main Form" for "Downtown Department Store". It includes input fields for "Customer Name", "Street Address", "City, State, Zip", and "Cell Phone Number". There is also an "Amount of Purchase" field. On the right, there are buttons for "Shipping Charges", "Clear All", "Additional Charges", "Print Invoice", "Broadway Shows", and "Print Preview".
- Main Form (Foreground):** A second instance of the "Main Form" window, slightly offset and in front of the first. It shows the same form with data entered: "Customer Name: Mark G. Simkin", "Street Address: 1234 Main Street", "City, State, Zip: Reno NV 12345", "Cell Phone Number: (123) 456 - 7890", and "Amount of Purchase: 100". The buttons on the right include "Shipping Charges", "Clear All", "Additional Charges", "Print Invoice", "Broadway Shows", "Print Preview", "Compute Total", "About Project", and a "Quit" button at the bottom.

Part C – Enhancements

Enhancement 1 – Zip Code Validation

For our first enhancement, we decided to create an additional zip code validation. This validation tests if the zip code entered matches a string of five integers. If the test fails the user is notified that the zip code is not in the proper format and then the sub will terminate execution. The validation was inserted into the existing validation rules for the Shipping, Additional Charges, and Broadway Click events.

```
ElseIf txtZip.Text Like "#####" = False Then  
    MsgBox("Zip must be like 00000.", MsgBoxStyle.Information, "Error")  
    txtZip.Focus()  
Exit Sub
```

Enhancement 2 – About Form

For our second enhancement, we decided to create an about form. This form informs the user of the developers who built the application and the current version number of the application. The form performs one task. If the user clicks on the “Ok” button, the about form will terminate execution.

Public Class frmAbout

```
Private Sub btnOk_Click(sender As Object, e As EventArgs) Handles btnOk.Click
    'Close about form after user clicks ok
    Me.Close()
End Sub
```

End Class
